

ABSTRACT

Method and System for Performance Reporting in a Network
Environment

5 An example of a solution provided here comprises: collecting data
from a plurality of probes, including at least one local probe
and at least one remote probe; and reporting the data. For
example, the reporting may comprise: reporting a first subset of
10 the data that originated from a local probe; reporting a second
subset of the data that originated from remote probes; and
employing a similar reporting format for said first subset and
said second subset. Thus comparison of data from a local probe
and data from remote probes may be facilitated. Another example
15 comprises: receiving data from at least one probe; comparing said
data with at least one threshold value derived from a service
level agreement; and outputting in a special mode any measured
response time value that is greater than the corresponding
threshold value. The following are provided: methods for
20 performance reporting in a network environment, systems for
executing such methods, and instructions on a computer-usable
medium, for executing such methods.
